Summary

Java Software Developer with hands-on experience building backend and full-stack applications using Java, Spring Boot, Hibernate, Servlets, JDBC, REST APIs, and MySQL. Built secure transactional systems and AI-powered applications involving RAG and work fluently with AI-assisted development tools like Claude Code and Cursor to build and ship faster. Seeking a Software Developer role that pairs strong backend fundamentals with modern, AI-augmented engineering practice.

Technical Skills

Languages: Java, Python, SQL, HTML5, CSS, React

Backend: Spring, Spring Boot, Hibernate, JEE, Servlets, Apache Tomcat, REST APIs, MVC, DAO

Databases: MySQL, MongoDB, SQLite, Supabase

AI / Generative AI: RAG, LLMs, LangChain, Google Gemini API, Embeddings, Vector Search, Qdrant, FAISS, Pinecone, Prompt Engineering

Tools: Git, GitHub, Docker, Maven, FastAPI, TensorFlow, Scikit-learn, Claude Code, Vercel, AWS

Experience

Java Full Stack Developer Intern

Feb 2026 – Aug 2026

Tap Academy

Bengaluru, India

- Developed a full-stack Java e-commerce and food-ordering style application using Servlets, JSP, JDBC, Hibernate, and Spring across a layered backend architecture.
- Implemented database-backed modules for users, menus, carts, and orders using Hibernate ORM, reducing direct JDBC boilerplate and simplifying entity-to-table mapping.
- Built cart, checkout, order-management, and CRUD workflows with REST APIs and transactional business logic across service and persistence layers.
- Applied Singleton and Factory design patterns where appropriate to improve object creation, reuse, and maintainability across application components.

Projects

MeshPay | *Offline Payment & Mesh Settlement Prototype*

- Engineered a Spring Boot prototype that simulates offline payment propagation through a device mesh and eventual submission by an internet-connected bridge.
- Implemented hybrid **RSA-OAEP + AES-256-GCM** encryption to protect payment payloads across untrusted intermediary devices and detect ciphertext tampering.
- Built a concurrency-safe settlement pipeline using **SHA-256 idempotency keys, atomic duplicate detection, transactional settlement, and optimistic locking** to prevent duplicate processing.
- Added replay and freshness validation and concurrency-focused tests to verify exactly-once settlement behavior under simultaneous duplicate delivery.

LectureLens | *Timestamp-Grounded YouTube RAG*

- Built a RAG-based learning assistant that answers English/Hinglish questions from YouTube DSA lectures and returns clickable citations that jump to relevant lecture timestamps.
- Developed an end-to-end pipeline using **faster-whisper, BGE-M3, Qdrant, Groq, and FastAPI**, with time-aware chunking to preserve source timestamps during retrieval.
- Added transcript caching, retry/backoff, atomic persistence, and grounding/refusal checks to improve reliability and reduce repeated expensive transcription.

Swadify | *Java Food Delivery Web Application*

- Built a Java MVC food-delivery application using **Servlets, JSP, JDBC, and MySQL** with authentication, restaurant/menu browsing, cart, checkout, ordering, and order history.
- Structured the application using **DAO, Model, Servlet, and Filter layers** and implemented relational workflows across users, restaurants, menus, orders, and order items.

Education

Bearys Institute of Technology

Mangalore, India

Bachelor of Engineering in Artificial Intelligence and Data Science; CGPA: 8.83/10.0

2022 – 2026

Yenepoya PU College

Karnataka, India

Pre-University Education – Science; Aggregate: 90%

2020 – 2022

Certifications & Hackathons

Certifications: Microsoft Azure AI Language • Microsoft Azure AI Vision • Microsoft Azure AI Document Intelligence • Google Foundations of Project Management • Python Programming – LetsUpgrade

Hackathons: AI Race Month – Grand Prix Hackathon • Google Gemini Events • Razorpay Buildathon • Wayzzy Grand Prix Pitch
